

Business Problem Statement

Background

A fashion retail/e-commerce business sells men's T-shirts sourced from 200+ brands (e.g. Allen Solly, U.S. Polo Assn., Tommy Hilfiger, GAP, Scotch & Soda, The Bear House, SNITCH, and others). With such a large and fragmented brand catalog, the merchandising and category management teams lack a consolidated view of brand-level performance — making it difficult to decide which brands to promote, renegotiate discount terms with, or expand assortment for.

Problem Statement

The business does not have a single, reliable view of brand-level performance across four critical dimensions:

1. Discounting behavior — which brands are being discounted most heavily, potentially eroding margins
2. Profitability — which brands generate the highest and lowest average profit %
3. Price positioning — which brands command the highest average sales price
4. Assortment depth — which brands offer the widest product variety

Without this visibility, decisions on brand partnerships, discount policy, and inventory/assortment planning are being made reactively rather than data-driven, risking margin leakage on over-discounted brands and under-investment in high-performing ones.

Objective

Build an interactive Power BI dashboard that enables stakeholders (merchandising, category, and finance teams) to:

- Identify the top 5 brands by average discount % to flag margin risk
- Identify the top 5 and bottom 5 brands by average profit % to guide brand partnership decisions
- Identify the top 5 brands by average sales price to understand premium positioning
- Identify the top 5 brands by number of product varieties to assess assortment depth
- Allow slicing/filtering by brand for ad-hoc drill-down

Target Audience

Merchandising managers, category managers, and business analysts responsible for brand strategy and pricing decisions.

Success Criteria

A single-page (plus detail view) interactive dashboard that surfaces the above insights at a glance, refreshable as new sales/catalog data comes in, replacing manual spreadsheet-based brand analysis.
